

# Download All About Marine Organisms

Accumulation of plastic waste in the oceans has become a pressing issue. • Here we review the susceptibility of marine invertebrates to microplastic uptake. Bioluminescence is the production of light by living organisms. This list of bioluminescent organisms is organized by environment, covering terrestrial, marine and microorganisms. A seashell or sea shell, also known simply as a shell, is a hard, protective outer layer created by an animal that lives in the sea. The shell is part of the body of the animal. If you need more in-depth information on gas impact on marine organisms, you can find it in this resource. It provides materials on levels, behavior and biological effects of methane, gas condensate and gas hydrates in the marine environment.
