

Download Engineering And Design Management Of Water Control Data Systems

Component reliability of weapon systems is basically a function of engineering design. Margins of safety used in engineering design to create high reliabilities must be managed by testing to failure techniques to obtain unbiased estimates of reliability. Engineers evaluate the water balance within a watershed and determine the available water supply, the water needed for various needs in that watershed, the seasonal cycles of water movement through the watershed and they develop systems to store, treat, and convey water for various uses. The Engineering area contains most of the reference material needed to design and construct a Capital Program project. Included are topics about Policy, Procedures, Specifications and Design Standards (Manuals, Guidelines, and Computer Aided Design and Drafting drawings).
