

Download Injuries To The Chest Wall

Hier sollte eine Beschreibung angezeigt werden, diese Seite lässt dies jedoch nicht zu. Recall Summary Name of Product: Children's and adult chests and dressers Hazard: The recalled chests and dressers are unstable if they are not properly anchored to the wall, posing serious tip-over and entrapment hazards that can result in injuries or death to children. A chest injury, also known as chest trauma, is any form of physical injury to the chest including the ribs, heart and lungs. Chest injuries account for 25% of all deaths from traumatic injury. Typically chest injuries are caused by blunt mechanisms such as motor vehicle collisions or penetrating mechanisms such as stabbings. An abdominal strain is a tear or rupture of part of the abdominal muscles, usually at the point where it attaches to the pelvis. An immediate, severe pain in the abdominal muscles is a sign of a rupture, and the pain will exacerbate when the muscles contract.
